Updates on the Studies of N* Structure with CLAS and the Prospects with CLAS12

ECT* 2015 Workshop on Nucleon Resonances, Trento, October 12-16, 2015, Italy

V.I. Mokeev, Jefferson Lab
Major Directions in the Studies of N*-Spectrum and Structure with CLAS

The experimental program on the studies of N* spectrum/structure in exclusive meson photo-/electroproduction with CLAS seeks to determine:

- $\gamma_v NN^*$ electrocouplings at photon virtualities up to 5.0 GeV$^2$ for most of the excited proton states through analyzing major meson electroproduction channels
- extend knowledge on N*-spectrum and on resonance hadronic decays from the data for photo- and electroproduction reactions with multiple mesons in the final state

A unique source of information on different manifestations of the non-perturbative strong interaction in generating different excited nucleon states as relativistic bound systems of quarks and gluons.

Review papers:
Studies of N* spectrum/structure suggest that ground and excited nucleon states consist of three dressed (constituent) quarks (C.Q.) coupled by non-perturbative strong interaction (ovals in the plot).

**Emergence of dressed quarks and gluons**

\[
\text{dressed quark} = \text{bare quark} + \text{dressing kernel}
\]

In the regime of large \(\alpha_s\) that is relevant for N* formation, dressed quarks and gluons are substantially different with respect to the bare quarks and gauge gluons. They acquire dynamical structure and momentum-dependent mass.
Dressed Quark Evolution from pQCD to Confinement Regimes

Consistent results from two different QCD-based approaches:

- more than 98% of dressed quark (N/N*) masses as well as their dynamical structure are generated non-perturbatively through dynamical chiral symmetry breaking (DCSB). The Higgs mechanism accounts for less than 2% of the nucleon & N* mass.

- the momentum dependence of the dressed quark mass reflects the transition from quark/gluon confinement to asymptotic freedom.
Quark Mass Function from the Studies of N/N* Structure

Studies of $\gamma_vNN^*$ electrocouplings (transition $N \rightarrow N^*$ form factors) represent the central direction in the exploration of the strong interaction in the non-perturbative regime.

- elastic form factors are sensitive to momentum dependence of quark mass function.
- mass function should be the same for dressed quarks in the ground and excited nucleon states.
- consistent results on dressed quark mass function determined from the data on elastic form factors and transition $\gamma_vNN^*$ electrocouplings are critical for reliable extraction of this quantity.
- results on transition $\gamma_vNN^*$ electrocouplings offer access to dynamics of quark-gluon vertex dressing beyond simplified rainbow-ladder truncation.

See Colloquium talk by C.D. Roberts Wednesday, October 14, 2.00 pm.

Studies of $\gamma_vNN^*$ electrocouplings (transition $N \rightarrow N^*$ form factors) represent the central direction in the exploration of the strong interaction in the non-perturbative regime.
Extraction of $\gamma_vNN^*$ Electrocouplings from the Exclusive Meson Electroproduction off Nucleons

**Resonant amplitudes**

$\gamma_v$  

\[ e \rightarrow e' \]

\[ N^*, \Delta^* \rightarrow \pi, \eta, \pi\pi, KY, \ldots \]

**Non-resonant amplitudes**

\[ N' \rightarrow \pi, \eta, \pi\pi, KY, \ldots \]

**Definition of $N^*$ photo-/electrocouplings employed in the CLAS data analyses:**

$$
\Gamma_{\gamma} = \frac{q_{\gamma}^2}{\pi} \frac{2M_{N^*}}{(2J_r + 1)M_{N^*}} \left[ |A_{1/2}|^2 + |A_{3/2}|^2 \right]
$$

$\Gamma_{\gamma}$ stands for $N^*$ electromagnetic decay widths at the photon point ($Q^2=0$) and $W=M_{N^*}$ on the real energy axis.

**Consistent results on $\gamma_vNN^*$ electrocouplings** from different meson electroproduction channels and different analysis approaches demonstrate reliable extraction of these quantities.
Summary of the CLAS Data on Exclusive Meson Electroproduction off Protons in N* Excitation Region

- \( d\sigma/d\Omega \)–CM angular distributions
- \( A_b, A_t, A_{bt} \)–longitudinal beam, target, and beam-target asymmetries
- \( P^0, P' \) –recoil and transferred polarization of strange baryon

Almost full coverage of the final hadron phase space in \( \pi N, \pi^+\pi^-p, \eta p, \) and \( K^+\Lambda \) and \( K^+\Sigma^0 \) electroproduction.

The data on exclusive electroproduction for all listed final states are available from CLAS and stored in the CLAS Physics Data Base [CLAS Data Base](http://clas.sinp.msu.ru/cgi-bin/jlab/db.cgi).
Approaches for Extraction of $\gamma_N N^*$ Electrocouplings from the CLAS Exclusive Meson Electroproduction Data

- Analyses of different pion electroproduction channels independently:
  - $\pi^+ n$ and $\pi^0 p$ channels:
    - Unitary Isobar Model (UIM) and Fixed-t Dispersion Relations (DR)
  - Reggeized background employing DR & Finite Energy Sum Rules: under development by JPAC
    - $\eta p$ channel:
      - Extension of UIM and DR
        - Data fit at $W<1.6$ GeV, assuming $S_{11}(1535)$ dominance
  - $\pi^+ \pi^- p$ channel:
    - Data driven JLAB-MSU meson-baryon model (JM)
  - $B_5$ Veneziano model for 3-body background: under development by JPAC

Global coupled-channel analyses of the CLAS/world data of $\gamma_{\gamma, N}$, $\pi N$, $\eta N$, $\pi\pi N$, $K\Lambda$, $K\Sigma$ exclusive channels:

See the talks by T-S.H. Lee Tuesday, October 13, 2.40 pm, H. Kamano and T. Sato Tuesday, October 13 3.40 pm.
Fits to Differential Cross Sections

\[ \gamma_{\nu} p \rightarrow \pi^+ \pi^- p \]
M. Ripani et al., PRL 91, 022002 (2003),
1.40 < W < 2.30 GeV; 0.5 < Q^2 < 1.5 GeV^2

W = 1.71 GeV, Q^* = 0.65 GeV^2

\[ \gamma_{\nu} p \rightarrow \pi^+ n \]
W = 1.68 GeV
Q^2 = 1.8 GeV^2
Resonant /Non-Resonant Contributions from the Fit of $\pi^+\pi^- p$
Photo-/Electroproduction Cross Sections within the JM Model

$W=1.51$ GeV, $Q^2=0.38$ GeV$^2$
E. N. Golovach. preliminary

$W=1.74$ GeV, $Q^2=0.0$ GeV$^2$

G. V. Fedotov et al, CLAS Coll. PRC 79, 015204 (2009)

Data uncertainties at $Q^2=0$
are dominated by systematics

full cross sections
within the JM model

Reliable isolation of the resonant cross sections is achieved

resonant part
non-resonant part
Consistent values of resonance electrocouplings from analyses of $N\pi$ and $\pi^+\pi^-p$ exclusive channels strongly support:

- reliable electrocoupling extraction;
- capabilities of the reaction models to obtain resonance electrocouplings in independent analyses of these channels.
Status and Prospects on Extraction of High-Lying N* Electrocouplings from CLAS Data

Independent fits in different W-intervals:
green: 1.51<W<1.61 GeV
magenta: 1.56<W<1.66 GeV
red: 1.61<W<1.71 GeV
blue: 1.66<W<1.76 GeV
black: 1.71<W<1.81 GeV

consistent electrocoupling values offer sound evidence for their reliable extraction.

\[ \pi^+\pi^-p \text{ electroproduction channel provided first preliminary results on } \Delta(1620)1/2^-; N(1650)1/2^-; N(1680)5/2^+; \Delta(1700)3/2^-; \text{ and } N(1720)3/2^+ \text{ electrocouplings with good accuracy.} \]

Prospect: evaluation of high-mass N* electrocouplings from independent analyses of KY channels.

See the talk by D. Carman, Tuesday, October 13, 9.20 am.

The values of resonance electrocouplings can be fond in: [https://userweb.jlab.org/~mokeev/resonance_electrocouplings/](https://userweb.jlab.org/~mokeev/resonance_electrocouplings/)

The prospects:

- $\gamma_N pN^*$ electrocoupling of all prominent nucleon resonances in mass range $M_{N^*} < 2.0$ GeV will be determined from independent analyses of $N\pi$, $N\pi\pi$, and KY channels;
- the web-site will be developed for evaluation of $\gamma_N pN^*$ electrocouplings for the aforementioned resonances at $0.2$ GeV$^2 < Q^2 < 5.0$ GeV$^2$. 
Access to the Dressed Quark Mass Function from the Data on the Transition $N \to N'$ Form Factors

\[ \Delta(1232)3/2^+ \]
Jones-Scadron convention

J. Segovia et al., Few Body Syst. 55,1185 (2014).

\[ N(1440)1/2^+ \]
Dirac $F_1^*$ and Pauli $F_2^*$

$N \to N(1440)1/2^+$ transition form factors

J. Segovia et al., arXiv: 1504.04386[nucl-th] accepted by PRL

The quark core contributions to transition form factors computed in a common DSEQCD framework starting from the QCD Lagrangian:
- Contact qq interaction, frozen constituent quark mass.
- Realistic qq interaction, running quark mass.
- the same but multiplied by the common factor fit to the data on the leading $A_{1/2}$ coupling at $Q^2 > 3.0$ GeV$^2$ (slide#18), which accounts for the product of the quark core fractions in ground and $N(1440)1/2^+$ states

Good data description at $Q^2 > 2.0$ GeV$^2$ achieved with the same dressed quark mass function for the ground and excited nucleon states of distinctively different structure provides strong evidence for:
- the relevance of dressed quark predicted by DSEQCD;
- promising prospect to probe dressed quark mass function from the results on nucleon elastic and transition form factors.
Discussion on the Future Efforts on Interpretation of the Experimental Results on N* Spectrum/Structure within DSEQCD

- Extension of DSEQCD evaluation of the N→N* transition form factor for the resonance of different quantum numbers:
  a) first orbital excitation of quark core in N(1535)1/2-, N(1520)3/2-, N(1650)1/2-
  b) first orbital excitation of quark core in Δ(1620)1/2-, Δ(1700)3/2-

- What we will learn from the studies of the N* states with quark core of L=1 on non-perturbative strong interaction dynamics in addition to the information available from ground states, spin-flavor flip, and radial excitations?

- Prospects to compute quark distribution amplitudes in N* states and the transition N→N* GPD’s

- How can we probe di-quark correlations in different N* states from the data on resonance electrocouplings?

- Synergy between DSEQCD and Quark Models for the N* structure.
Relating $\gamma_v NN^*$ Electrocouplings to the first Principles of QCD within the Framework of Light Cone Sum Rule (LCSR) & Lattice QCD (LQCD) Approaches

The shape parameters of $N(1535)1/2^-$ leading twist quark distribution amplitude (DA) $\varphi_{ij}$, $\eta_{ij}$ were fit to the CLAS electrocoupling data within LCSR, while normalization parameters $\lambda_{1N}$, $f_{N^*}$ were taken from the LQCD evaluations at the central values (V.M. Braun et al., Phys. Rev D89, 094511 (2014)).

Successful description of the CLAS data at $Q^2>2.0$ GeV$^2$, where LCSR is applicable, with normalization parameters from LQCD demonstrates the approach potential of relating $\gamma_v NN^*$ electrocouplings to the first principles of QCD

D.G. Richards, Thursday, October 15, 9.20 am.
Prospect for extension of LCSR for accessing quark DA of different excited proton states.

Prospect for LQCD evaluation of DA moments of different excited proton states.

Possibility to compare N(1535)1/2− quark DA: a) fit to the electrocoupling data within LCSR, b) derived employing LQCD b) derived employing DSEQCD. Can consistency of these results prove understanding of non-perturbative strong interaction from the first principles of QCD?

Prospect for LQCD evaluation of resonance electrocouplings accounting for decays of excited nucleon states and approaching physical pion mass.

Possibilities for mutual comparison between LQCD and DSEQCD.

Predictive power of the approaches based on the first principles of QCD:
   a) hybrid baryon spectrum
   b) hybrid baryon electrocouplings
   c) electrocouplings and hadronic decays of “missing” N*
Quark Core and Meson-Baryon Cloud in the Structure of N(1440)1/2⁺ Resonance

The mechanisms of meson-baryon dressing:

\[ \gamma \rightarrow M \rightarrow M' \rightarrow N^* \]

Description of the N(1440)1/2⁺ A$_{1/2}$ electrocoupling by the light front quark models that incorporate the inner core and outer meson-baryon (MB) cloud:

- Nπ loops MB cloud; running quark mass.

- Nσ loops for MB cloud; frozen constituent quark mass.

MB cloud inferred from the CLAS data as the difference between the data fit and evaluated within DSEQCD quark core.

Successful description of the N(1440)1/2⁺ quark core from the QCD Lagrangian has been achieved for the first time with the framework of DSEQCD!

The structure of N(1440)1/2⁺ resonance is determined by complex interplay between inner core of three dressed quarks in the first radial excitation and external meson-baryon cloud.
Interplay Between Quark Core and Meson-Baryon Cloud in the Structure of Different Excited Nucleon States

Almost direct access to:
- quark core from the data on N(1520)3/2−: prospect to explore dressed quark mass function, qqG vertex, and di-quark correlations;
- meson-baryon cloud from the data on N(1675)5/2−: shed light on the transition from confined quarks in inner core to colorless mesons and baryons in N* exterior

MB dressing abs. values (Argonne-Osaka).

Measure exclusive electroproduction cross sections from an unpolarized proton target with polarized electron beam for $N\pi$, $N\eta$, $N\pi\pi$, KY:

$$E_b = 11 \text{ GeV}, \, Q^2 = 3 \rightarrow 12 \text{ GeV}^2, \, W \rightarrow 3.0 \text{ GeV} \text{ with the almost complete coverage of the final state phase space}$$

See the talk by R.W. Gothe, Tuesday, October 13, 2.00 pm.

CLAS12 is the only facility foreseen in the world capable to map-out $N^*$ quark core under almost negligible contributions from meson-baryon cloud

A unique opportunity to probe dressed quark mass function in the transition from confinement to pQCD regime and to explore the nature of confinement and its emergence from QCD from the results on transition $N \rightarrow N^*$ form factors/electrocouplings

The experiments will start in the first year of running with the CLAS12 detector.
Dressed quark mass function

Opportunity to probe dressed quark mass function in the transition from quark-gluon confinement to pQCD regimes for the first time.

Consistent results on quark mass function from electrocouplings of different resonances at $Q^2 > 5$ GeV$^2$ will prove reliable access to this fundamental quantity.

Resonance electrocouplings
(available from CLAS and expected from CLAS12)

**N(1680)5/2$^+$**

**N(1440)1/2$^+$**

Light Front Quark Model
(quark core & MB cloud)

DSEQCD:

- constant quark mass
- running quark mass from DSEQCD

• Modeling of the amplitudes other than photon-proton s-channel resonances for the exclusive $N\pi$, $KY$, $\pi\Delta$, and $\rho p$ electroproduction at $Q^2$ up to 12 GeV$^2$ from minimal accessible $W<2.0$ GeV to 3.0 GeV. The models should account for:
  a) hard processes in terms of diagrams with factorized explicit quark degrees of freedom;
  b) relevant soft contributions in terms of meson-baryon degrees of freedom.

\[
\begin{align*}
\text{full} = \alpha \text{ MB d.o.f.} + \beta \text{ quark d.o.f.}
\end{align*}
\]

\[
M = \pi, K, \rho
\]
\[
B = N/\Delta, Y, p
\]
\[
\alpha + \beta = 1
\]

• Adjustment of the reaction model parameters to all measured with the CLAS observables at $Q^2>3.0$ GeV$^2$

See the talk by: P. Kroll, Thursday, October 15, 11.10 am.

The most urgent task for theory support of the upcoming experiments on the N* structure studies with CLAS12!

Recommendation:
The PAC encourages the preparation of a full proposal. However, we emphasize that the 11 GeV running should be put forward as a Run Group Proposal, if it is indeed to run in parallel with other approved experiments. Further, the additional beam time at 6.6 and 8.8 GeV must be considered as a separate proposal that may include other measurements that could be carried out with the additional beam time.

Flagship experiment for the studies of the N* structure at 0.05 GeV² < Q² < 1.0 GeV²

See the talks by: L. Lanza, Tuesday, October 13, 11.10 am.
Use of the CLAS12 forward tagger will make it possible to obtain the data on $N\pi$, $KY$, $N\pi\pi$ electroproduction at $0.05 \text{ GeV}^2 < Q^2 < 1.0 \text{ GeV}^2$ of the best statistical and systematical accuracy ever achieved.

An excellent opportunity to extend the approaches for amplitude extraction from the photoproduction data to electroproduction at small $Q^2$ and to determine $N^*$ parameters under minimal model assumptions:

See the talk by: A. Sarantsev, Tuesday, October 13, 11.50 am.
A. D’Angelo, Friday, October 16, 9.20 am.

New opportunities from the $N^*$ structure studies at low $Q^2$:

• Check evidence for new $N^*$ states from exclusive photoproduction data in analyses of exclusive photo-/electroproduction data combined examining possibility to fit the data with $Q^2$-independent $N^*$ hadronic parameters.

• Explore how $S_{1/2}$ electrocouplings are approaching the photon point at $Q^2$ as low as 0.05 GeV$^2$.

• The studies of $N^*$ meson-baryon dressing in details.

• Opportunities to probe di-quark correlations in $N^*$ states of different quantum numbers.
Conclusions

• High quality meson electroproduction data from CLAS allowed us to determine the electrocouplings of most well-established resonances in mass range up to 1.8 GeV from analyses of $\pi^+n$, $\pi^0p$, $\eta p$ and $\pi^+\pi^-p$ electroproduction channels. Consistent electro-coupling values obtained independently from $N\pi/N\pi\pi$ exclusive channels demonstrated reliable electrocoupling extraction and capabilities of the developed reaction models to determine $N^*$-parameters from independent analyses of $N\pi/N\pi\pi$ exclusive electro-production.

• Physics analyses of the CLAS results on resonance electrocouplings revealed the structure of $N^*$-states at $Q^2<5.0$ GeV$^2$ as complex interplay between meson-baryon and quark degrees of freedom.

• Successful description of elastic and transition form factors to different low-lying resonances achieved at $Q^2>2.5$ GeV$^2$ within the framework of DSEQCD demonstrated promising opportunity to probe dressed quark mass function getting an access to the essence of non-perturbative strong interaction and its emergence from QCD.

• First results on N(1535)$1/2^-$ quark distribution amplitudes (DA) have recently become available from analyses of the CLAS electrocoupling data within the framework of the Light Cone Sum Rules and Lattice QCD offering another promising avenue of relating resonance electrocouplings to the first principles of QCD.
Outlook

• After 12 GeV Upgrade CLAS12 will be only available facility worldwide capable of obtaining electrocouplings of all prominent N* states at still unexplored ranges of low photon virtualities down to 0.05 GeV$^2$ and highest photon virtualities ever achieved for exclusive reactions from 5.0 GeV$^2$ to 12 GeV$^2$ from the measurements of exclusive $N\pi$, $\pi^+\pi^-p$, and KY electroproduction.

• The expected results will allow us:
  a) search for hybrid baryons;
  b) establish the existence of new baryon states based on the fits of photo-/electroproduction data with $Q^2$-independent N* hadronic parameters;
  c) explore the emergence of meson-baryon cloud from quark-gluon confinement and di-quark correlations;
  d) access quark distribution amplitudes in N* states;
  e) to probe the dressed quark mass function at the distance scales where the transition from quark-gluon confinement to pQCD regime is expected, addressing the most challenging problems of the Standard Model on the nature of >98% of hadron mass and quark-gluon confinement.

• Development of the reaction models for extraction of $\gamma_vpN^*$ electrocouplings at $Q^2$>5.0 GeV$^2$ accounting for the quark d.o.f in non-resonant amplitudes is urgently needed for support of N* Program with CLAS12!

• Success of N* Program with the CLAS12 strongly depends from productive synergy between experiment/phenomenology/theory. It will be very beneficial for Jefferson Lab and hadron physics community worldwide.

Consistent results on photocouplings of resonances with masses above 1.6 GeV from analyses of $N\pi$ and $\pi^+\pi^-p$ channels demonstrate reliable extraction of these fundamental quantities.
Further Evidence for the Existence of the New State $N'(1720)3/2^+$ from Combined $\pi^+\pi^-p$ Analyses in both Photo- and Electroproduction

Almost the same quality of the photoproduction data fit at $1.66 \text{ GeV} < W < 1.76 \text{ GeV}$ and $Q^2=0, 0.65, 0.95, 1.30 \text{ GeV}^2$ was achieved with and without $N'(1720)3/2^+$ new states.

N* hadronic decays from the data fit that incorporates the new $N'(1720)3/2^+$ state

Successful description of $\pi^+\pi^-p$ photo- and electroproduction data achieved by implementing new $N'(1720)3/2^+$ state with $Q^2$-independent hadronic decay widths of all resonances contributing at $W\sim 1.7 \text{ GeV}$ provides strong evidence for the existence of new $N'(1720)3/2^+$ state.

The contradictory BF values for $N(1720)3/2^+$ decays to the $\pi\Delta$ and $\rho p$ final states deduced from photo- and electroproduction data make it impossible to describe the data with conventional states only.
The photo-/electrocoupings of N’(1720)3/2+ and conventional N(1720)3/2+ states:

<table>
<thead>
<tr>
<th>Resonance</th>
<th>Mass, GeV</th>
<th>Total width, MeV</th>
</tr>
</thead>
<tbody>
<tr>
<td>N’(1720)3/2+</td>
<td>1.715-1.735</td>
<td>120±6</td>
</tr>
<tr>
<td>N (1720)3/2+</td>
<td>1.743-1.753</td>
<td>112±8</td>
</tr>
</tbody>
</table>

N’(1720)3/2+ is the only candidate state for which the results on Q²-evolution of transition electrocoupings have become available offering the insight to the structure of the new baryon state.
Extension of the CLAS $\pi^+\pi^-p$ Electroproduction Data

Fully integrated $\pi^+\pi^-p$ electroproduction cross sections off protons
- Nine 1-fold differential cross sections are available in each bin of $W$ and $Q^2$ shown in the plots.
- Resonance structures are clearly seen at $W \sim 1.5$ GeV and $\sim 1.7$ GeV at $0.4 < Q^2 < 5.0$ GeV$^2$ (red lines).

Analysis objectives:
- Extraction of $\gamma_NN^*$ electrocouplings and $\pi\Delta$, $\rho p$ decay widths for most $N^*$s in mass range up to 2.0 GeV and $0.4 < Q^2 < 5.0$ GeV$^2$ within the framework of JM-model.
- First results on electrocouplings of high-lying ($M_{N^*}>1.6$ GeV) orbital nucleon excitations and high-lying parity partners.
Analysis of the ep → π⁺π⁻p CLAS data at W~1.7 GeV in the JM15 model

conventional N*-states with πΔ, ρp couplings fit to the data

2.85<χ²/d.p.<3.03 (1.66 GeV<W<1.76 GeV)

W=1.71 GeV, Q²=0.65 GeV²

3/2⁺(1720) candidate state is included to the fit

2.56<χ²/d.p.<2.80 (1.66 GeV<W<1.76 GeV)

W=1.71 GeV, Q²=0.65 GeV²

- Fit of θ⁻, θ⁺, θₚ angular distributions requires essential contribution(s) from the resonance(s) of Jπ=3/2⁺.
- Single state of Jπ=3/2⁺ should have major πΔ (>60%) and minor ρp (<5%) decays in order to reproduce pronounced Δ-peaks in π⁺p and to avoid the ρ-peak formation in π⁺π⁻ mass distributions.
\begin{align*}
\frac{d\sigma}{d\Omega} &= (\sigma_T + \epsilon \sigma_L) + \epsilon \sigma_{TT} \cos 2\Phi + \sqrt{\epsilon(1+\epsilon)} \sigma_{LT} \cos \Phi + h \sqrt{\epsilon(1-\epsilon)} \sigma_{LT'} \sin \Phi
\end{align*}

$E = 5.5 \text{ GeV}$, $W: \text{thr} - 2.6 \text{ GeV}$, $Q^2 = 1.80, 2.60, 3.45 \text{ GeV}^2$

[Carman et al., PRC 87, 025204 (2013)]
$\mathbf{K^+\Sigma^0 \text{ Structure Functions}}$

$\frac{d\sigma}{d\Omega} = (\sigma_T + \epsilon \sigma_L) + \epsilon \sigma_{TT} \cos 2\Phi + \sqrt{\epsilon(1+\epsilon)}\sigma_{LT} \cos \Phi + h\sqrt{\epsilon(1-\epsilon)}\sigma_{LT'} \sin \Phi$

$E = 5.5 \text{ GeV}, \ W: \text{thr} - 2.6 \text{ GeV}, \ Q^2 = 1.80, 2.60, 3.45 \text{ GeV}^2 \quad \text{[Carman et al., PRC 87, 025204 (2013)]}$
Signals from N* states in the CLAS KY electroproduction data

D. Carman, private communication

\[ C_l = \int \left\{ \frac{d\sigma}{d\theta_{K_T}} + \varepsilon \frac{d\sigma}{d\theta_{K_L}} \right\} P_l(z) d(-z) \]

\[ z = \cos (\theta_K) \]

the structures in W-dependencies of \( C_l \) moments at the same W-values in all \( Q^2 \)-bins are consistent with the contributions from resonances of spin-parities listed in the plots.

reaction model(s) are needed for extraction of N* parameters from KY electroproduction.
Charting Meson-Baryon Mechanisms of the JM Model

- $\pi\Delta^{++}$ meson-baryon channel accounts for the major part of $\pi^+\pi^-p$ electroproduction cross section. Relative resonant contribution to $\pi\Delta^{++}$ channel increases with $Q^2$.

- $2\pi$ direct production decreases substantially at $W$ from 1.5 to 1.7 GeV offering an indication for sizable final hadronic interactions between the $\pi^+\pi^-p$ final state and others open meson-baryon channels.

- $\pi\Delta$, $\rho p$-amplitudes decomposed over PW’s of angular momenta $J$ can be provided from the data fit.

- The request for reaction theory: guidance for the development of analytical continuation of $\pi\Delta$, $\rho p$-amplitudes allowing us to extract resonance electrocouplings from residues at the resonance pole positions.
Resonant /Non-Resonant Contributions from the Fit of $\pi^+\pi^-p$ Electroproduction Cross Sections within the JM Model

$W=1.51\text{ GeV}, Q^2=0.38\text{ GeV}^2$

$W=1.51\text{ GeV}, Q^2=0.43\text{ GeV}^2$

Reliable isolation of the resonant cross sections is achieved

Full cross sections within the JM model
Resonance electrocouplings in regime of quark core dominance can be related to the running quark masses and their dynamical structure.

12 GeV experiment E12-09-003 will extend access to electrocouplings for all prominent N* states in the range up to $Q^2=12\text{GeV}^2$.

Probe the transition from confinement to pQCD regimes, allowing us to explore how confinement in baryons emerge from QCD and how >98 % of baryon masses are generated non-perturbatively via dynamical chiral symmetry breaking.
Evidence for $3/2^+ (1720)$ Candidate-State in $\pi^+\pi^- p$ Electroproduction

Conventional states only:

Conventional & $3/2^+ (1720)$ candidate-state:

Successful data description requires two nearly degenerated N*-states of $J^\pi=3/2^+$. One of them (new) decays mostly (47-64%) to the $\pi\Delta$ with minor decays (<10%) to the $\rho p$ final states, the other (conventional N(1720)$3/2^+$) has comparable decay probabilities to the $\pi\Delta$ (39–55%) and to the $\rho p$ (23–49%) final states.
